SMOKE SPILL AXIAL FLOW FAN

JTF SERIES - IMPULSE JET FAN

JCF SERIES- INDUCTION JET FAN

ABOUT US

SUBURBAN INDUSTRIAL WORKS PVT. LTD. was incepted in the year 1981 for manufacture of Centrifugal and Axial Flow Fans with complete infrastructural setup with design, man power, plant and machinery. Personnel with experience of decades in respective field along with technically and qualified support staffs soon changed the complexion of the organization. Mingled with the product quality and a strong marketing network within a short span of time the company emerged as a force to reckon with HVAC, Processing and other core sector industries.

COMPANY PHILOSOPHY

With our established product credibility throughout the country our mission is to keep pace with the continuous and upgradation of technology as per demands of different segment of industry and excel with the product quality simultaneously. In support of our mission we are already an ISO 9001:2015 Certified organization.

QUALITY MANAGEMENT

SIWL has adopted very strict quality measures to ensure the uniform acceptable quality keeping in view the requirement of products and the application are met all times. Right from inputs to finished products the raw materials are tested from reputed and Govt. Approved test house before processing the finish products.

During manufacture all products are subject to DP, Radiographic, Ultrasonic, X-Ray Tests as and when required. All Rotor portion are subject to Dynamic Balancing before assembly as per ISO: 1940.

Any further tuning required is carried out by our additional facility of Portable Dynamic Balancing Machine. To ensure meeting guaranteed performances of products we have Testing Laboratory/ Test Beds for testing of fans as per AMCA, BS and IS Standards supported with varied range of measuring instruments with updated calibration

CONCEPT OF MODERN CAR PARK VENTILATION SYSTEM

The Ductless Ventilation system has been developed to ventilate the Undergrounds both for Carbon Monoxide (CO) removal during Normal Condition and extracting smoke during an Emergency Situation, typically in case of fire. This can be handled by using a single system using Jet Fans.

The complete system consists of Jet Fans (Impulse or Induction Type), Main Supply and Exhaust Fans (Axial Type), Carbon Monoxide Sensors, Control Panel and for the authentication of the system design a CFD Analysis is provided for support and selection for the most suitable option.

ADVANTAGES OF MODERN CAR PARK VENTILATION

Compared to a ducted ventilation system, the innovative Jet Fan System ensures multiple benefits over the conventional Ducted System in terms of low cost and efficiency associated with its design, installation, operation and usage.

Design

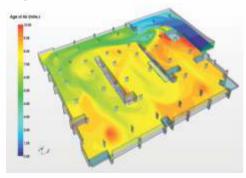

- The compact size of the Jet fans allows to optimise the spaces and their flexibility of installation both when building new properties and / or refurbishing and or certifying existing building
- It saves design time as it does not require a complex ducked system to be designed and implemented
- The system effectiveness can be measured with CFD (Computational Fluid Dynamics) modeling
- It allows the project designer to benefit from a better pre-sales customer service
- The project's final cost are in line with expected cost.

Installation

- It removes the need for costly and complex ducted and grilled systems
- The fans are easy to install, ensuring time saving in terms of hours of work
- The reduced size of the jet fans easies installation of other systems (sprinklers, lighting etc.)
- Ease of schedule and breakdown maintenance.

Operation

Major savings in running costs ensured by this non-duct jet fan ventilation system distinctive features.

- Ventilation can be fully or partly operated: the CO Sensors and the Smoke detectors in fact ensure that only the ventilators located in the areas where pollution levels are exceeded or where a fire has started are enabled.
- Less total power required as the accurate design ensues the optimal size of the ventilation system, more specifically, the inlet and exhaust fans can be smaller as the jet fans generate a negligible pressure drop compared to ducted system.

CFD SIMULATION

Computational fluid Dynamics can simultaneously predict airflow, heat transfer and contaminant transport in and around building. A CFD model is built upon fundamental physical equation of fluid flow and energy transfer. The technique is capable of providing time dependent and as well as steady state solutions to the coupled differential equations that govern fluid flows.

HOW IT WORKS

The objective of the CFD is to design of ventilation system for the basement car parking area using jet fans. The specific aim is to find the optimal location, number and configuration of the jet fans required for the ventilation of the car parking, for the given positions of inlets and exhaust, and given configuration of the exhaust fans, such that it meets requirements of CO exposure limit set by health and safety regulations.

CFD Calculation is essential to ensure that all areas of the car park are correctly ventilated and in the event of fire, fume extraction is optimised. It is also required to establish the accurate size of the ventilation system and the correct position of the jet fans and of other exhaust and or inlet fans

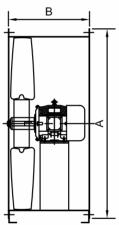

This calculation is based on simulation, combining variables such as the required number of air changes per hours, air volume and direction and structural features of each car park (in 3D Model). The processed data generate dynamic scenarios based on air speed profiles, particle movement and airflow distribution. This allows a customised solution to be produced. This methodical approach ensures not only to assess the system effectiveness by also the most cost effective solution as oversized projects are avoided.

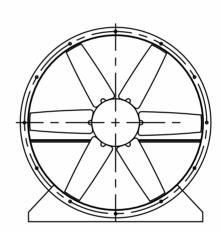

SMOKE SPILL AXIAL FLOW FAN (TLJ Series)

Smoke Spill fans are used for smoke exhaust system at commercial buildings, shopping malls, hospitals, etc. These fans are placed on the ramp opening to the environment which extracts smoke and releases it in the environment.

- Dual use: For daily ventilation and smoke extraction in case of fire. Symmetrical Aero-Dynamic adjustable blades for maximum efficiency.
- Motors IP55 insulation class H (smoke extract);
- Motors IP55 insulation class F (CO-exhaust), according to EN
- 60034-5/IEC 85
- Casing manufactured from galvanized steel or mild steel (as per requirement).
- Conforming to EN 12101-3 (300 °C for 120 mins/ 2hrs)
- Fan size from 315 to 1600 mm diameter.

JTF SERIES - IMPULSE JET FAN

- Dual Use: For daily ventilation and smoke extraction in case of fire (300 °C/120 min.)
- Symmetrical Aero-Dynamic blades for maximum thrust with low sound level
- Motors IP55 insulation class H (smoke extract); Motors IP55 insulation class F (CO-exhaust), according to EN 60034-5/IEC85
- Casing manufactured from galvanized steel
- Conforming to EN 12101-3 (300 °C for 120 mins/ 2hrs)

JCF SERIES- INDUCTION JET FAN

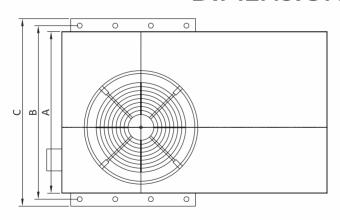

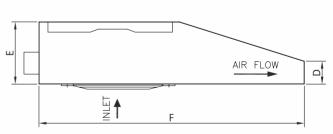

- Highly efficient, aerodynamically designed internal flow elements.
- Available with powerful 50 or 100N thrust capacities
- Compact low profile design makes it suitable for applications with low ceiling heights
- Integral mounting feet allows unit to be easily mounted to celling
- Low noise generated due to the centrifugal fan character.
- Conforming to EN 12101-3 (300 °C for 120 mins/ 2hrs)
- Motors are IP-55 with Class-H Insulation for Smoke Extraction.

OTHER PRODUCTS OFFERED

CENTRIFUGAL FAN

These type of fans are used in hvac system and for general ventilation.

TUBE AXIAL FAN

Tube axial fans are used in supply and exhaust air systems at office space, stores and kitchen. Also used for pressurization at staircases, lift shaft and lift lobby.

VANE AXIAL FAN

Vane axial fans have guide vanes that increase the fan efficiency. Apart from commercial application these fans are used for industrial application.

CABINET FAN

For supplying fresh / conditioned air through duct work. Available with hdpe filter and speed selector switch for volume control.

CIRCULAR DUCT INLINE FAN

Circular duct inline fans are used in hvac system where low noise is criteria.

RECTANGULAR DUCT INLINE FAN

Rectangular duct inline fans are used in hvac system where higher volume is required.

PROPELLER FAN

Propeller fans are used for exhaust of low or medium quantity of air in kitchens, pump rooms and toilet.

ACCESSORIES

VOLUME CONTROL DAMPER

Manual or automatic vcd is used to control air flow and pressure. Dampers are of various types like back draft damper, fire damper, smoke damper etc are used for different applications.

AIR DISTRIBUTION PRODUCT

Difuser, grill of various types are used for proper distribution of air in the service areas.

DUCT WORK

Proper duct work is designed for smooth air distribution in different location.

CABLE

Suitable cable is used in power & control line for flawless operation.

PLC PANEL

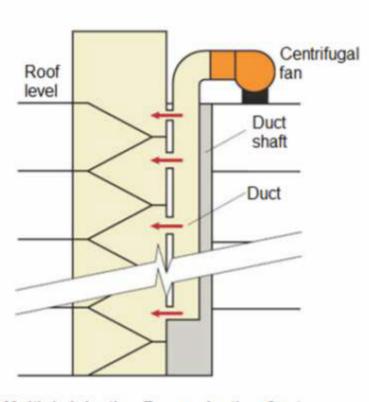

Cntrol panel is used to operate the system and also to monitor the functions of equipment, hmi is installed infront of the control desk. Signals showing the healthiness of the drive, operation readiness and deposition level of co are displayed on the hmi screen.

CO DETECTOR

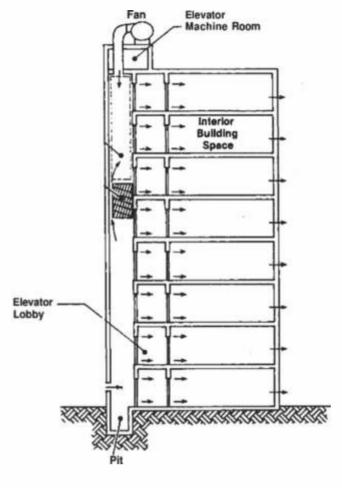

Carbon monoxide (co) is very poisionous and inflammable gas and only detected by co sencors. Co detectors are designed to measure co levels and send the signals to plc panels before co accumulation reaches a dangerous level and start the ventilation fans.
